

Title

S

A custom operations platform built to reduce manual restaurant administration, improve accuracy, and make repeatable manager workflows easier to execute.

P

Why It Was Built

Daily restaurant operations rely on many small administrative workflows that are easy to underestimate: invoices, counts, ordering, sales, labour, production planning, backups, and reporting.

Before this app, those workflows were spread across manual spreadsheets, paper count sheets, repeated calculations, local files, and manager memory. That created duplicated effort, inconsistent results, and avoidable risk.

StoreOps Manager was built because the work already existed. The app turns that repeated work into a structured system.

What It Does

StoreOps Manager supports the main back-office workflows managers use to control cost and prepare operations:

- P
- I
- Inventory count templates, count entry, printed count sheets, valuation, and order guides
- F
- W
- P
- P
- L
- C

What It Replaces

Business Value

The value is not only that the app exists. The value is that it standardizes work that affects cost control, ordering, reporting, and manager time.

Technical Scope

This is not a simple spreadsheet macro. It is a maintained desktop operations application with a real data model and cloud-backed architecture.

Compensation Framing

This work produced business software that replaces ongoing manual administration and creates operational value beyond normal shift responsibilities.

A

- T
- I
- Continued use creates ongoing maintenance, support, training, and enhancement responsibility.

Suggested Pitch

"I built StoreOps Manager because several recurring back-office workflows were being handled manually across spreadsheets, paper, and repeated calculations. The app now centralizes inventory, invoice handling, order guides, cost reporting, production planning, labour hours, daily labour cost, tip pool, backups, updates, and cloud-backed store login.

This has value because it saves manager time, improves consistency, reduces manual errors, and gives the business a more reliable operational system. I would like to discuss compensation for the completed work, and also how we should handle ongoing maintenance and future development if the company wants to keep using it."

Discussion Ask

R

- R
- A
- D
- Decide whether future development is handled as paid project work, a role responsibility with adjusted compensation, or a separate maintenance arrangement.

Closing Position

StoreOps Manager is already doing work that would otherwise require many manual tools and repeated manager hours.

The compensation request is not only for code. It is for identifying an operational gap, designing the workflow, building the system, testing it, deploying it, and continuing to support something the business can rely on.
